1. If $\frac{360^o}{\theta}$ is an even integer, then number of images formed is $n = \frac{360^o}{\theta} - 1$.

2. If $\frac{360^o}{\theta}$ is not an integer, then number of images formed is $n = \left[\frac{360^o}{\theta}\right]$, where [.] is the greatest integer function.

3. If $\frac{360^o}{\theta}$ is an odd integer and the object is placed

(a) Symmetrical, then number of images formed is, $n = \frac{360^o}{\theta} - 1$.

(b)Unsymmetrical, then number of images formed is, $n = \frac{360^o}{\theta}$.

Chart

S.No.	θ in degrees	n = 360°/θ	Number of objects formed	
			asymmerically	symmetrically
1	0	∞	∞	∞
